

Liberty Under Pressure – Getting it Right

As Liberty-based herbicide-tolerance platforms become more common in corn and soybean production, glufosinate application intensity is expected to increase. 'Getting it Right' with respect to appropriate application practices will be critical to ensure this increase in application intensity remains sustainable over the longer term. This session will build on the information presented by Dr. Thostensen and provide practical insights into factors specifically impacting Liberty herbicide performance across multiple crops. Key topics will include formulation, adjuvants, application timing, and other critical variables, all aimed at helping Liberty continue to deliver consistent results, even 'Under Pressure'.
